

**“Santa Maria del Giudice” Tectonic Unit**  
**Scisti di San Lorenzo (LOR)**

San Lorenzo a Vaccoli, road to Monte Vignale, outcrop located along Via di Villa Altieri.

Vertical section about 2 metre thick. Intermediate level (thickness about 50 cm; yellow circle) consisting of finely laminated light grey metasilite and thin pelitic levels. The transition to the overlying metasandstone is marked by a discontinuous carbonaceous level of centimetre thickness (1-3 cm).

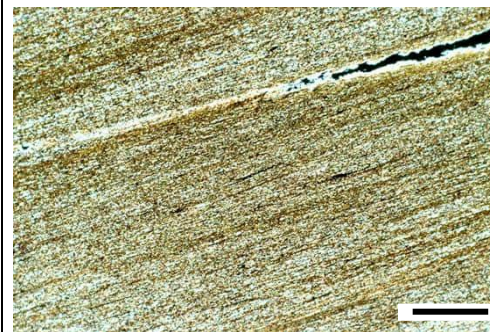

**MP2E**

43°47'32.68"N, 10°29'32.98"E

1.8 cm

Metasilite with laminated structure, layers of millimetre thickness (1-2 mm) separated by discontinuous fracture surfaces. The foliation is characterized by phyllosilicate with abundant detrital quartz and muscovite.

Well foliated texture consisting of very fine-grained quartz and phyllosilicate grain.

scale bar: 0.7 mm.
